Claims

Claims

Claims

- D1: HILDING ELMQVIST: "A UNIFORM ARCHITECTURE FOR DISTRIBUTED AUTOMATION" ADVANCES IN INSTRUMENTATION AND CONTROL, INSTRUMENT SOCIETY OF AMERICA, RESEARCH TRIANGLE PARK, US, Vol. 46, No. PART 2, 1991, pages 1599-1608, XP000347589 ISSN: 1054-0032
- D2: WO 97/15877 A (LENG HELMUT; ZINK THOMAS (DE); JUNG HERBERT (DE); REITER HERMANN (DE)) 1 May 1997 (1997-05-01)
- D3: US-B-6 369 8411 (WITTE MANFRED ET AL) 9 April 2002 (2002-04-09)
- D4: US 2002/047865 A1 (LINGSCHEID VICTOR ET AL) 25 April 2002 (2002-04-25).
- Novelty, inventive step
- 1.1 The solution proposed in claim 1 of the present application is not inventive (PCT Article 33(3)). The reasons are as follows:

Document D1, which is considered the closest prior art, discloses (following as closely as possible the wording of claim 1 of the present application; the

references between parentheses relate to document D1).

- a system for generating an automation code from descriptions containing control-relevant information (abstract, page 1605, paragraph 6), having
- components specified in the description, wherein the components have ports and are represented by at least one functional group (page 1600, paragraph 7, "functional aspects", page 1601, paragraphs 1-3, page 1605, paragraph 10 "inputs");
- input/output information to the ports, derived from directed relationships between the components which are contained in the descriptions (page 1601, paragraph 7 "graphically connecting them together", paragraph 10 "sequences", figure 5 "execution order", page 1605, paragraph 4, "structured graphical editor is used for editing of equations and sequences"),
- signals belonging to the components, wherein the signals are intended to be sent via the ports of the components (page 1605, paragraph 10 "inputs" clearly there are also corresponding "outputs"),
- and a code generator for producing automation code by combining the signals (page 1605, paragraphs 5-10).

The subject matter of claim 1 differs from the above in that "first means for defining meta information for the signals" are mentioned.

The problem to be solved by the present invention is therefore understood to be that of making available additional information on the signals, if necessary.

To a person skilled in the art is it obvious that, if necessary, signals can be provided with meta information. In document D1 (page 1605, paragraph 10), the information deposited in the "data-flow-model", which can be used to sort the instances, can, for example, be referred to as "metainformation" attributed in part to the signals.

Depending on the request, a person skilled in the art would therefore provide the signals with meta information and in doing so arrive at the solution described in claim 1, without thereby exercising inventive skill.

Please note:

Document D2 discloses a CAE system for the object-oriented design of an industrial plant (abstract: "object-oriented engineering of a plant") and generation of applications (page 3, paragraph 1). Technical features leading to the automatic, inevitable rejection of faulty wiring are assigned to wiring contacts (page 4, paragraphs 2-3). In other words, meta information of the signals is defined, and automation code is generated by interconnecting the signals. Consequently, document D2 is likewise prejudicial to an inventive step of claim 1.

1.2 Claim 2 is not inventive (PCT Article 33(3)) because the method described above is clearly suitable for manufacturing and process engineering plants (see, for example, document D1, abstract "automation system", "process pictures").

- 1.3 Claims 3 and 4 are not inventive (PCT Article 33(3)) because the use of drawings with control-relevant information is known to a person skilled in the art from the graphical programming of automation processes and it is obvious that input means for these must be provided (see, for example, document D1, abstract "graphical programming").
- 1.4 Claim 5 is not inventive (PCT Article 33(3)) because the use of material flows and other flows for automation coding is known to a person skilled in the art. See, for example, document D1 (page 1601, paragraph 7 "information flow", page 1605, paragraph 10 "data-flow model").
- 1.5 Claim 6 is not inventive (PCT Article 33(3)) because a person skilled in the art knows that distributed applications are well suited to automation (see, for example, document D1, abstract "distributed objects", page 1605, paragraph 5 "distributed program").
- 1.6 Claims 7-12 are not inventive (PCT Article 33(3)), for the reasons already given for claims 1-6.

2. Other observations

2.1 Claim 1 is not clear and does not meet the requirements of PCT Article 6 insofar as the subject matter for which protection is sought is not defined clearly. The following vague or functional statements make it impossible for a person skilled in the art to determine which technical features are necessary in order to carry out the functions specified:

International application No. PCT/DE 03/03614

- "with input/output information derived from [...] relationships [...] contained in the descriptions"; the extremely convoluted sentence structure makes it difficult to determine which preposition belongs to which participle and which subject, and hence also makes it difficult to determine the scope of protection of the claim.
- "system [...] from [...] descriptions, having [...] first means for defining meta information"; this is vague, as it is not clear whether "having" refers to "system" or "descriptions". In the first case the means could be, for example, a keyboard. As far as the scope of protection is concerned, it is not clear how meta information differs from normal information.

For the purpose of point 1. above, the claims were interpreted in the light of the description.
